

Javelina Versus Wild Boar

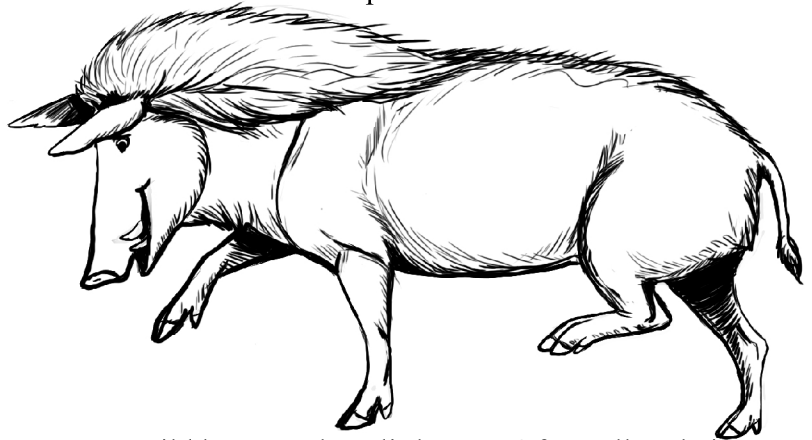

Javelinas are **herbivores**. Though they mainly eat plants, occasionally they will eat animals too.

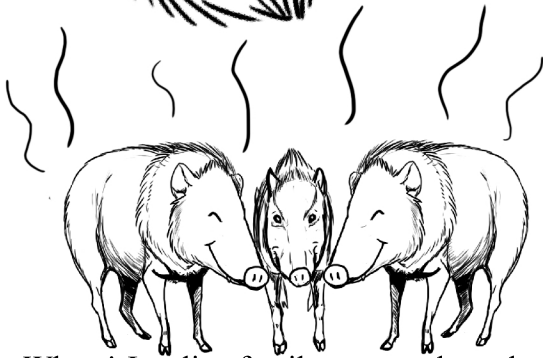

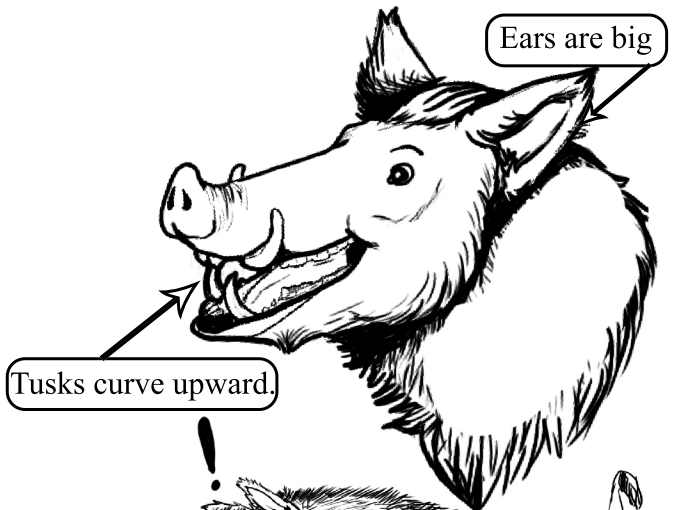

Javelinas are 2 feet tall, and usually 35 - 55 pounds.

Wild Boar are **omnivores**. That means they eat plants and meat.

Wild boar can be a little over 4 feet tall at their shoulder, and can weigh up to 220 pounds!

Whew! Javelina family groups share the same smelly odor. By rubbing their scent glands on each other, they know who is a part of their herd.

Wild Boar are also a social animal. They live in groups of mostly females and young, but they do not have a smelly family odor.
